

Suominen is committed to energy savings

For an industrial company like ours whose strategy is based on growth and improving profitability through sustainability, customer orientation and efficiency, it is essential to reduce energy consumption. In this sense, last year we replaced the previous chiller unit, which had become obsolete due to its age and high energy consumption, with a new, more energy-efficient chiller.

This project has had the financial support of the European Union, having been selected in the Pluriregional Operational Program of Spain 2014-2020 (POPE), as well as the participation of the IDAE and the IVACE, obtaining a grant of €2,320.71, for the energy saving project that we carried out in 2020, replacing the two compressors, both the main one and the backup one, with a new compressor that is allowing us to reduce energy consumption. "Project supported by IDAE and IVACE aid, co-financed by the European Union within the ERDF Operational Program 2014-2020."
